

Promote positive health outcomes through the delivery of foundational public health services.

Communicable Disease Surveillance Summary Report

Jefferson County, Missouri

June 2026

NOTES ON THE DATA:

- All data and information are conditional and may change as more reports are received.
- Case definitions are established by the Missouri Department of Health and Senior Services' (DHSS) Communicable Disease Investigation Reference Manual and the CDC's National Notifiable Diseases Surveillance System (NNDSS). The totals reflect the number of confirmed and probable cases reported; suspect cases are not included.
- Data is reported in epidemiologic weeks established by the CDC's Morbidity and Mortality Weekly Report (MMWR). The MMWR week starts on a Sunday and ends on Saturday. Values for MMWR week range from 1 to 53, although most years consist of 52 weeks. The 2026 MMWR calendar began on January 4, 2026.
- Case date may be based on the onset date, diagnosis date, specimen date, or test date.
- Excluded from this report are Sexually Transmitted Diseases, Influenza, and COVID-19.
- Jefferson County Health Department monitors all reportable disease cases year-round. Figures 1. and 2. include detailed views of diseases or conditions that may be of importance during the time of year this report is published. Variables such as outbreaks or the seasonality of communicable diseases may affect the number of cases per month and call for a more in-depth look. Seasonal change in the incidence of infectious diseases is common.

**Table 1. Number of Enteric Cases by Month,
Jefferson County, Missouri**

Disease or Condition	Five Previous Months					Year to Date Comparison		
	February 2026	March 2026	April 2026	May 2026	June 2026	YTD 2026	YTD 5 Previous Year Mean	YTD Alert ¹
Campylobacteriosis	4	2	2	8	5	25	12.6	*

Other/Miscellaneous Totals	35	35	36	46	36	217	163.6	

**Figure 1. Pertussis
Jefferson County, Missouri**

Pertussis, also known as whooping cough, is a very contagious respiratory illness caused by a type of bacteria called *Bordetella pertussis*. Pertussis may begin like a common cold, but unlike a cold, coughing can last for weeks or months. Babies younger than 1 year old are at greatest risk for getting whooping cough and having severe complications from it. People can spread the bacteria from the start of symptoms and may continue to spread the bacteria for at least 2 weeks after coughing begins. Taking antibiotics early in the illness may shorten the amount of time someone's contagious period. Preventive antibiotics are also known as postexposure antimicrobial prophylaxis (PEP). These are medicines given to someone who has been exposed to harmful bacteria to help prevent them from getting sick. Some people should receive antibiotics to prevent them from getting sick if they have been around someone with whooping cough. The best way to prevent whooping cough is to get vaccinated. CDC recommends whooping cough vaccination for everyone.

There were 4 cases of Pertussis reported during June 2026 in Jefferson County. During the previous 5 years, the number of reported cases has ranged from 0 to 13 per month. A year-to-date alert has been noted for Pertussis. Year-to-date alerts are present when the total cases in the current year are more than one standard deviation above the mean for the same time period in the previous five years.

**Figure 2. Ehrlichiosis
Jefferson County, Missouri**

Ehrlichiosis is a tick-borne illness caused by the bacteria *Ehrlichia chaffeensis*, *E. ewingii*, or *E. muris eauclairensis*. These bacterial zoonotic pathogens infect animal reservoir hosts and require a tick to be transmitted to humans. The majority of reported cases are due to infection with *E. chaffeensis*. In Missouri, Ehrlichiosis is primarily transmitted by the Lone Star tick. In rare cases, *Ehrlichia* species have been spread through blood transfusion and organ transplant. Doxycycline is the treatment of choice for adults and children of all ages with ehrlichiosis.

There were 14 cases of Ehrlichiosis reported during June 2026 in Jefferson County. During the previous 5 years, the number of reported cases has ranged from 0 to 12 per month. A year-to-date alert has been noted for Ehrlichiosis. Year-to-date alerts are present when the total cases in the current year are more than one standard deviation above the mean for the same time period in the previous five years.
